

About Me...

I am Atlas...

I am 8 years old. I like animals especially endangered one. I also like to go on adventures and my favorite color is green. And this website will help explain why climate change is a problem and how you can help stop it.

Climate Change

Some pictures of animals that are endangered because of climate change.

Causes of climate change...

The main causes of climate change are deforestation and burning fossil fuel.

Climate change is a problem....

Climate change is a problem because Climate change can end up making an animal species go extinct and if one animal species goes extinct then the animals that eats that species of animal will go extinct to.

Or if the animal that went extinct is a predator than the animals that the predator eats will become so popular that they will eat all the plants if they are herbivores and then there won't be any plants so that that animal will die and then it will destroy a whole food web.

And when this happens it can end up knocking out the whole entire planet. Global warming is not a good name for climate change because that would make everyone think that everything's warming up when climate change is really just making weather more extreme.

How sad would you be if there were no animals like bunnies or other cute objects alive? Some ways that kids can help prevent climate change is by sending letters to your lawmakers and telling them to make a law about climate change. Some ways that grownups can help our by going out in protesting about climate change.

A lot of the food that we humans eat comes from the Amazon rain forest and some materials that we use come from the Amazon rain forest to like rubber. And most of the medicine that we use at least one ingredient is from plants in the Amazon rain forest.

So if we cut down all of the Amazon rain forest we would not have as much fruit or food from the Amazon rain forest like pineapples and mango. Plus we would not have as much medicine for people so it could end up affecting people fast to.
